Foreword

The implementation of the 2030 Agenda for Sustainable Development is just at the outset. Pursuing the broad and ambitious Sustainable Development Goals (SDGs) poses major challenges at all levels, from subnational to regional and international, and calls for timely decisions on effective policy actions in a rapidly evolving world of scarce resources.

In this context, the ability to design sound policies and monitor their outcomes is a key requirement. Measuring progress towards international goals and their national and subnational specifications is of paramount importance. Statistics is the main tool for taking stock and building upon the many small efforts that are carried out to pursue the main objectives, such as reducing hunger and malnutrition, tackling rural poverty, promoting sustainable agricultural development, hence contributing to addressing climate change, promoting inclusive food systems, and improving resilience to extreme conditions.

FAO's strategic framework, being aligned with the SDGs, makes the Organization ready and able to support countries in strengthening their statistical capacities, which are an essential prerequisite for pursuing and monitoring the objectives of the 2030 Agenda. The role of FAO as "custodian" for 21 of the 230 indicators of the SDG Monitoring Framework testifies to the centrality of the Organization in this process.

This publication presents, at a glance, selected key indicators on agriculture and food security, and is meant as an easy-access quick reference. The content is in two sections, one thematic and one country-specific; and is organized along four main themes.

The setting provides information on resources employed in agriculture, including the use of land, labour, capital and inputs. Data in this section highlight the pressure that demographic and macroeconomic development is exerting on food systems.

Hunger dimensions describe the state of food insecurity and malnutrition in the world, starting from the SDG2 indicators for which FAO holds responsibility, which are the prevalence of undernourishment and the access to food measured through the Food Insecurity Experience Scale (FIES).

Food supply offers detailed information on the nature and quantity of world agricultural production and trade, while at the same time considering different utilizations, such as food, feedstuffs and others.

Environment highlights the crucial issue of sustainability, by considering the interactions of agriculture with the ecosystem in the evolving context of climate variability and change.

On all these matters, FAO is committed to supporting national, regional and international partners in improving the availability of high-quality and timely data, in view of promoting sustainable agricultural development and SDG 2, Zero Hunger.

Pietro Gennari

Chief Statistician

José Rosero Moncayo Director, Statistics Division

How to use this pocketbook

The structure

This publication presents selected key indicators related to agriculture and food security that the international community, governments, the private sector and civil society can use to assess current trends and prioritize their actions. It is divided into two sections, one thematic and one country-specific. It presents a variety of dimensions of agriculture and food security along four main focus areas:

The setting, including land, labour, capital and inputs.

Hunger dimensions, highlighting food availability, access, stability and utilization.

Food supply looks at agricultural production, trade and utilization.

Environment examines land, water, forestry and emissions.

This publication includes data from FAOSTAT and other FAO sources, as well as other partner organizations from the international community. The source for all indicators, as well as more information about each of them, is included in the "Definitions" section at the end (page 236).

Country definitions and classification

The country classification adopted in this publication is based on the United Nations M49 classification (http://unstats.un.org/unsd/methods/m49/m49.htm). The country names have been abbreviated. The official FAO names can be found at http://termportal.fao.org/faonocs/appl/.

Aggregations

Regional and subregional aggregates are based on the country groupings defined in the United Nations M49 classification. A small subset of indicators is based on the aggregation rules defined in *The State of Food Security and Nutrition in the World 2018* report (http://www.fao.org/3/19553EN/19553en.pdf) and are used in the "Hunger dimensions" section.

Two types of aggregations are used: sum and weighted mean. A sufficiency condition is imposed when computing the aggregation – the aggregation is computed only when sufficient countries have reported data, and the current threshold is set at 50 percent of the variable and the weighting variable, if present.

Data presentation conventions

The cut-off date for the data in this publication is 26 September 2018.

The asterisk (*) in charts and maps indicates the most recent year available in the specified time interval. In the country profiles, when the country data have not been reported for the reference year, data in italics indicate that the value for the most recent year of complete information is shown. Exceptions are population data, for which the latest information available refers to the year 2017; and regional aggregates of prevalence of undernourishment and prevalence of severe food insecurity, which show 2017 data.

In the tables, n.a. means not applicable or, for an aggregate, not analytically meaningful. A 0 or 0.0 means zero or a number that is small enough to round to zero at the displayed number of decimal places.

The ~ in the maps refers to the range specified in the class intervals.

In addition:

- <2.5 proportion less than 2.5 percent
- <0.1 less than 100 000 people

The setting

Population

Notwithstanding the long-term decline of growth rates, the world's population has doubled since the early 1960s, approaching 7.5 billion people.

This is the outcome of fast-improving life expectancy that combines with the high fertility of younger populations.

Urban dwellers, based on national definitions, are currently 55 percent of the global world population.

CHART 3: Life expectancy at birth, top and bottom 10 countries (2016)

CHART 4: Total rural population

2

3

Economy

The data reconfirm the hypothesis that with the development of a country, the share of agriculture in GDP goes down, which usually is accompanied by migration of the labour force from agriculture to nonagricultural sectors. In order to keep agriculture playing its vital role as provider of food, fibre and fodder, it is important to increase per worker productivity of the agricultural sector, which can come through greater investments in agriculture and use of improved technologies.

CHART 6: Agriculture, value added per worker, top 20 countries with the highest values (2007-17*)

CHART 5: Value added in agriculture, forestry and fishing, industry and services, share of GDP (2017)

FIGURE 2: Value added in agriculture, share of GDP (2011-16*)

Labour

Shares of agricultural employment in total employment decline as income grows. But the ability of agriculture - and the related activities along the food production chains to demand employment translates in key income opportunities for poor and vulnerable population groups. Collecting high-quality data on those who work in agriculture is particularly important and challenging. Much labour in agriculture is informal, characterized by high levels of pluri-activity and seasonality. It can be selfemployed or unpaid, and/or supplied by family members. As a large share of the working poor are involved in agriculture, developments in this sector have a major impact on welfare.

CHART 10: Female employment in agriculture in top 20 countries, share of female employment (2007-17*)

CHART 11: Male employment in agriculture in top 20 countries, share of male employment (2007–17*)

FIGURE 3: Employment in agriculture, share of total employment (2011-17*)

Fertilizers and pesticides

chemical or mineral fertilizers was 110 Mt nitrogen (N), 49 Mt phosphate (P2O5) and 39 Mt potash (K). With respect to 2002, this represents increases of 34 percent, 40 percent and 45 percent respectively. For each nutrient, the top three countries together represent more than half of the total (Charts 14, 15), which is also reflected in the totals by region (Chart 16). World total agricultural use of fertilizers per hectare of cropland (arable land and permanent crops) has also increased, reaching 69 kg N/ha, 30 kg P2O5/ha and 24 kg K/ha in 2015 (Chart 13). Regarding pesticide use, distribution of data availability and total amount of active ingredients used by country are shown in Figure 4.

CHART 15: Phosphate fertilizers use in nutrients, top 20 countries (2016)

Investments

In the coming decades. increased investment in agriculture is going to be crucial for meeting the challenge of adequately feeding the 821 million chronically undernourished people counted today. In FAOSTAT, investment flows are recorded by government expenditure in agriculture, development cooperation flows to agriculture, foreign direct investment and credit to agriculture. Although total development flows are increasing in the long run, the share of crops, livestock, fisheries, aquaculture and forestry as a whole is declining. In most regions, except Europe, the share of agriculture in total credit is also declining.

CHART 18: Total credit to agriculture, forestry and fishing, top 20 countries (2016)

CHART 19: Government expenditure on agriculture, forestry and fishing, 10 countries with highest and lowest average AOI (2010-16)

FIGURE 5: Government expenditure on agriculture, share of total outlays (2011-16*)

Prices

Prices are the main determinants of resource allocation for production. Factors that can drive food consumer prices are affected most by natural calamities or political instability, which reduce the production or disrupt the supply chain. Most countries with high inflation in recent times were noted to be facing similar situations. The volatility of international markets is usually not fully transmitted to domestic consumer markets due to national policies protecting them.

CHART 22: Top 20 countries with the highest inflation rate (average Jan-Dec 2017)

CHART 23: Top 20 countries with the lowest inflation rate (average Jan-Dec 2017)

Hunger dimensions

Hunger and food insecurity

Hunger is traditionally measured by the prevalence of undernourishment, which is the inability to acquire enough food to meet dietary energy requirements. New evidence continues to point to a rise in world hunger in recent years after a prolonged decline. In 2017, an estimated 821 million people - approximately one in every nine people - in the world still lack sufficient food to lead an active and healthy life. Complementary statistics based on the Food Insecurity Experience Scale (FIES) show that close to 10 percent of the world population was exposed to severe food insecurity, corresponding to about 770 million people.

CHART 25: Top 20 countries with the highest number of undernourished (2015-17)

World	8.9	10.2

CHART 26: Top 19 subregions with the highest number of severely food insecure people (2016)

FIGURE 7: Prevalence of undernourishment (2015-17)

Food availability

food security. Supplying enough food to the reference population is a necessary, but condition insufficient, for ensuring adequate access for individuals. In most countries and regions, high food availability is associated with relatively low prevalence of undernourishment and low prevalence of severe food insecurity. Conflicts and climate change have a cumulative effect on food production. Political conflicts and climate-related disasters in some countries have undermined the food availability in recent years, leading to the rise in global hunger.

CHART 30: Average protein supply, top 20 countries (2011-13)

FIGURE 8: Average value of food production (2014-16)

Food access

An adequate supply of food does not in itself guarantee household level food security. Access to food is primarily determined by incomes, food prices and the ability of households and individuals to obtain access to social support. Individuals' access to food is also heavily influenced by social variables, including gender positioning and power hierarchies within households. In addition to economic affordability, physical access to food is also facilitated by adequate infrastructure, such as rail lines and paved roads.

CHART 33: Prevalence of severe food insecurity, top 17 subregions

FIGURE 9: Rail lines density (2007-14*)

Stability

Over the last ten years, food and agricultural markets have entered an unexpectedly turbulent phase, characterized by large supply shortfalls and price swings. Meanwhile the number of conflicts is also on the rise. Exacerbated by climaterelated shocks, conflicts seriously affect food security and are a cause of much of the recent increase in food insecurity. The poorer the household, the stronger the impact of external shocks, as poor households spend a proportionally higher share of their incomes on food.

CHART 37: Per capita food supply variability, top 20 countries (2013)

CHART 38: Cereal import dependency ratio, top 20 countries (2011–13)

Food utilization

Utilization emphasizes the nutritional aspects of food security. It is commonly understood as the way the body makes the most of nutrients from food. Sufficient energy and nutrient intake depend on nutritious, safe and diversified diets, a clean environment (safe water and improved sanitation facilities), access to health care, and intra-household distribution of food. Poor utilization of food can impose economic and social costs in countries at all economic levels.

CHART 40: Stunting in children under 5, top 20 countries (2008-17*)

CHART 41: Wasting in children under 5, top 20 countries (2008–17*)

FIGURE 11: Prevalence of anaemia among women of reproductive age (2016)

Food supply

Dietary energy supply

calculated at the national level that serves as an estimate of the amount of calories available for from food human consumption. It does not yield any information on the affordability, access, or consumption of dietary energy by different population groups. It can be useful for determining if a country's food supply contains enough dietary energy to meet population needs, and whether measures need to be taken to improve the amount of dietary energy available for the population. The overall average dietary energy supply has increased from 2 716 kcal/cap/day in 1999-2001 to 2 904 kcal/cap/day in 2015-17.

CHART 44: Average dietary energy supply, top 20 countries (2015–17)

CHART 46: Average dietary energy supply by region

FIGURE 12: Average dietary energy supply adequacy (2015-17)

Crop production

The importance of crop production is related to harvested areas, returns per hectare (yields) and quantities produced. For the past five decades, growth in crop production has been driven mainly by a significant increase in yields per unit of land, together with crop intensification. Trends are not uniform across regions, however. Most of the growth in wheat and rice production in Asia and Northern Africa has been from gains in yield, while expansion of harvested land has led to production growth of maize in Latin America and sub-Saharan Africa, and this has had an impact on people in developing countries who depend on agriculture for their living standards.

CHART 47: Top 20 crop producing countries based on net per capita crop production value (2016)

Ginger	8.1
Mushrooms and truffles	7.5

CHART 48: Top 20 food (excl. fish) producing countries based on net per capita food production value (2016)

Crop utilization

Cereals, which include wheat, rice, barley, maize, rye, oats and millet, make up the bigger part of crop production. They continue to be the most important food source for human consumption. However, external factors, such as rising incomes and urbanization, are causing diets to become higher in protein, fats and sugar. In addition, livestock and biofuel production have grown at a faster rate than crop production, and will probably continue to do so. This is causing a shift away from crops such as wheat and rice, towards coarse grains and oilseeds to meet demands for food, feed and biofuel.

The world food economy is being increasingly driven by the shift of diets towards animal-based products such as meat, milk and dairy. As a result, agriculture is being affected, not only through growth of livestock production, but also through linkages to other sectors that supply feeding stuffs, such as crops and fisheries. Global livestock production offers opportunities for agricultural development, poverty reduction and food security gains, but the rapid pace of change risks and systemic risks to the natural resources, including land use, need particular attention.

Fisheries and aquaculture

Fish is an important component in people's diets, providing about 3.2 billion people with almost 20 percent of their average intake of animal protein. Capture fisheries continue to dominate world output, but aquaculture accounts for a growing percentage of total fish supply. Fishery and aquaculture sectors are particularly important in developing countries. providing both food and livelihoods.

CHART 59: Fish production indices

Agricultural trade

Most of the food consumed worldwide is grown locally. Where there is not enough local production to meet demand, trade has been instrumental in filling the gap. The scale of food and agricultural trade today is unprecedented. In real terms, the value of international flows has increased around fivefold over the past five decades, reflecting global trends in the overall volume of trade. However, this expansion has been unevenly distributed across regions. High-income countries have generally outpaced developing regions, although several of the latter have comparative advantages in food and agricultural production.

Data for fish excluded from total food

CHART 61: Top 20 food (excl. fish) exporting countries (2016)

Environment

Land

In 2016 agriculture used over one-third of total land area. Agriculture used more than 50 percent of total land in Asia, but less than 25 percent in Europe (Chart 63). Twenty countries represented more than 70 percent of total arable land (cropland used for annual crops such as cereals and soybean). India, United States of America, Russian Federation, China and Brazil alone reached 40 percent (Chart 64). A different set of 20 countries have over 70 percent of world permanent crops area (the portion of cropland planted with tree crops such as oil pam or orchards). Indonesia, China, India, Malaysia and Brazil alone covered nearly 40 percent (Chart 65). Permanent meadow and pastures represented 70-80 percent of the agricultural land area in all regions except for Europe (Chart 66).

Water

Global demand for water has risen sharply over the last century. Total annual water withdrawal from agriculture, municipalities and industries rose from less than 580 km³ in 1900 to more than 3 900 km3, according to the latest available data. Agriculture accounts for approximately 70 percent of total freshwater withdrawal in the world, mostly through irrigation. This has been crucial for gains in food production because irrigation reduces drought risk and encourages crop diversification, thus also enhancing rural incomes. While irrigated agriculture represents about 20 percent of the cultivated land, it contributes to 40 percent of global food production.

CHART 67: Countries with the lowest

CHART 69: Freshwater withdrawal by agricultural sector, share of total, top 20 countries (2006-16)

Forestry

Forests make vital contributions to biodiversity. They also sustain a range of economic activities and act as a source of food, medicine and fuel for more than a billion people. The latest estimate of the world's total forest area is more than 4 billion hectares, corresponding to about 30 percent of total land area. But today forests face unprecedented pressures. Changes in land cover have caused the most pressing environmental issues in recent decades. The impact of deforestation and land use intensification, especially on soil degradation, has been significant.

CHART 72: Top 20 exporters of forest products (2016)

CHART 74: Forest characteristics (2016)

CHART 71: Production of selected forest products

CHART 73: Top 20 importers of forest products (2016)

30 40

Greenhouse gas emissions

Agriculture GHG emissions contributed about 5 billion metric tonnes of CO₂eg to the atmosphere each year during the period 2005-16. Related land use activities, for instance deforestation or drainage of peatlands, released a similar amount (Chart 78). Together agriculture and land use represented one-fourth of world emissions. Twenty countries represented more than two-thirds of the agricultural total, with China, India, Brazil and the United States of America alone emitting 50 percent (Chart 76). Asia was the region with the largest share of emissions (Chart 75). A different set of 20 countries represented 85 percent of world total net emissions from land use, with the top four countries alone responsible for 50 percent (Chart 77).

Definitions

Agricultural land

Land used for cultivation of crops and animal husbandry. The total of areas under "Cropland" and "Permanent meadows and pastures". *Source:* FAO, Statistics Division *Owner:* FAO

Agricultural water withdrawal

Annual quantity of self-supplied water withdrawn for irrigation, livestock and aquaculture purposes. It can include water from primary renewable and secondary freshwater resources, as well as water from over-abstraction of renewable groundwater or withdrawal from fossil groundwater, direct use of agricultural drainage water, direct use of (treated) wastewater, and desalinated water. Water for the dairy and meat industries and industrial processing of harvested agricultural products is water included under industrial withdrawal. Note: Withdrawal is synonymous with abstraction.

Source: FAO, Land and Water Division (AQUASTAT)

Owner: FAO

Agricultural water withdrawal as % of total renewable water resources

Water withdrawn for irrigation in a given year, expressed in percent of the total renewable water resources. This parameter is an indication of the pressure on the renewable water resources caused by irrigation. Note: While freshwater withdrawal as a percentage of total renewable water resources refers to withdrawal of primary and secondary surface water and groundwater, agricultural water withdrawal also includes non-conventional sources of water (such as direct use of wastewater and agricultural drainage water, desalinated water). Thus in some countries agricultural water withdrawal as a percentage of total renewable water resources can be higher than freshwater withdrawal as a percentage of total renewable water resources

Source: FAO, Land and Water Division (AQUASTAT) Owner: FAO

Agriculture area actually irrigated

Land area actually irrigated that is used for agriculture. *Source:* FAO, Statistics Division *Owner:* FAO

Agriculture Orientation Index (AOI) of government expenditure

This is the ratio of the agriculture share in government expenditure, over the agriculture contribution to the economy. An AOI greater than 1 shows higher prominence in government expenditure to agriculture than its contribution to the economy, as measured by GDP, while an AOI less than 1 shows more prominence of non-agricultural sectors.

Source: FAO, Statistics Division Owner: FAO

Agriculture, forestry and fishing (AFF)

It refers to broad agricultural sector including crop growing and animal production, forestry and logging, and fishing and aquaculture. These subsectors correspond to Section A of the International Standard Industrial Classification (ISIC), revision 4 and are covered in its Divisions 1, 2 and 3, To distinguish with the agricultural sector (crop and livestock in Division 1 of ISIC), the broad agricultural sector is abbreviated in this publication as AFF. Source: United Nations Statistics Division Owner: UN

Agriculture, value added

This is the total value added in AFF. The value added is the net output of a sector after adding up value of all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The International Standard Industrial Classification (ISIC), revision 3 or 4, determines the origin of value added. Agriculture here refers to the broad agricultural sector (AFF). *Source:* World Bank

Owner: World Bank

Agriculture, value added per worker (constant 2010 USD)

Value added per worker is a measure of labour productivity in agricultural sector - value added per unit of input. Value added per worker is calculated by dividing value added of a sector by the labour force employed in the sector. For international comparisons constant 2010 USD have been used.

Source: World Bank

Owner: FAO, ILO and World Bank

Aid commitment flows to agriculture, forestry and fishing

The DAC uses a sector classification specifically developed to track aid flows and to permit measuring the share of each sector (e.g. health, energy, agriculture) or other purpose category "non-sector allocable aid" (e.g. general budget support, humanitarian aid) in total aid. The sector of destination is assigned by answering the question "Which specific area of the recipient's economic and social structure is the transfer intended to foster?".

Anaemia among women of reproductive age, prevalence

Prevalence of anaemia among women of reproductive age refers to the combined prevalence of non-pregnant women with haemoglobin levels below 12 g/dL and pregnant women with haemoglobin levels below 11 g/dL.

Source: World Bank

Owner: World Health Organization, Global Health Observatory Data Repository/World Health Statistics

Animal fats

Include butter, ghee, cream, raw animal fats and fish oils. *Source:* FAO, Statistics Division *Owner:* FAO

Aquaculture fish production

Defined as the farming of aquatic organisms. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding, protection from predators, etc. Farming also implies individual or corporate ownership of the stock being cultivated. For statistical purposes, aquatic organisms which are harvested by an individual or corporate body which has owned them throughout their rearing period contribute to aquaculture, while aquatic organisms which are exploitable by the public as a common property resource, with or without appropriate licences, are the harvest of fisheries. In the case of capture-based aquaculture, only the incremental growth (or weight gain) in captivity, could and should be reported as the production from aquaculture. Data included here cover aquaculture production of fish, molluscs, crustaceans and miscellaneous aquatic animals but exclude production of marine mammals, crocodiles, corals, pearls, sponges and aquatic plants. Fish production is the sum of aquaculture and capture fish production.

Source: Fisheries and Aquaculture Department (Fishery and Aquaculture statistics) *Owner*: FAO

Arable land

The total of areas under temporary crops, temporary meadows and pastures, and land with temporary fallow. Arable land does not include land that is potentially cultivable but is not normally cultivated. *Source:* FAO, Statistics Division *Owner:* FAO

Area harvested

Refer to the area from which a crop is gathered. Area harvested, therefore,

excludes the area from which, although sown or planted, there was no harvest due to damage, failure, etc. It is usually net of temporary crops and sometimes gross of permanent crops. Net area differs from gross area insofar as the latter includes uncultivated patches, footpaths, ditches, headlands, shoulders, shelterbelts, etc. If the crop under consideration is harvested more than once during the year as a consequence of successive cropping (i.e. the same crop is sown or planted more than once in the same field during the year), the area is counted as many times as harvested Source: FAO, Statistics Division Owner: FAO

Bilateral development flow (aid) to AFF

Bilateral flows are provided directly by a donor country to an aid recipient country. Bilateral commitments are recorded in the full amount of expected transfer, irrespective of the time required for the completion of disbursements. *Source*: OECD *Owner*: OECD

Capture fish production

Defined as the hunting, collecting and gathering activities directed at removing or collecting live wild aquatic organisms. The capture production statistics here indicates the nominal catches of aquatic organisms, killed, caught, trapped or collected for all commercial, industrial, recreational and subsistence purposes in live weight equivalent. Data included here cover capture production of fish, molluscs, crustaceans and miscellaneous aquatic animals but exclude production of marine mammals, crocodiles, corals, pearls, sponges and aquatic plants. Fish production is the sum of aquaculture and capture fish production.

Source: Fisheries and Aquaculture Department (Fishery and Aquaculture statistics) *Owner*: FAO

Cattle and buffaloes

Common ox (*Bos taurus*); zebu, humped ox (*Bos indicus*); Asiatic ox (subgenus *Bibos*); Tibetan yak (*Poephagus grunniens*). Indian, Asiatic, pigmy, water buffalo (*Bubalus bubalus*; *B. arnee*; *B. depressicomis*); African buffalo (genus *Syncerus*); American bison (*Bison bison*); European bison (*Bison bonasus*); beeffalo (cross between bison and domesticated beef animal). Excludes wild bison and buffalo.

Source: FAO, Statistics Division Owner: FAO

Cereal import dependency ratio

This indicator provides a measure of the dependence of a country or region from cereal imports. The higher the value of

the indicator, the higher the dependence. Specifically, the cereal imports dependency ratio tells how much of the available domestic food supply of cereals has been imported and how much comes from the country's own production. It is computed as (cereal imports - cereal exports)/(cereal production + cereal imports - cereal exports) * 100. Given this formula the indicator assumes only values <= 100. Negative values indicate that the country is a net exporter of cereals. The indicator is calculated in three year averages, to reduce the impact of possible errors in estimated production and trade, due to the difficulties in properly accounting of stock variations in major food. Source: FAO, Statistics Division Owner: FAO

Cereals

Include wheat, rice paddy, barley, maize, popcorn, rye, oats, millets, sorghum, buckwheat, quinoa, fonio, triticale, canary seed, mixed grain and cereals nes. *Source:* FAO, Statistics Division *Owner:* FAO

Cereals and preparations

Includes cereals, flours and cereal grains that are either rolled, flaked, pearled, sliced or kibbled. *Source*: FAO, Statistics Division *Owner*: FAO

Consumer price index (all items)

Consumer price index (CPI) (all items) measures the price change between the current and reference periods of an average basket of goods and services purchased by households. The CPI (all items) is typically used to measure and monitor inflation, set monetary policy targets, index social benefits such as pensions and unemployment benefits. *Source:* IMF and UNSD *Owner:* IMF and UNSD

Consumer price index (food)

The food CPI measures the price change between the current and reference periods of the average basket of food items purchased by households. The food CPI is rescaled to a unique base year of 2010 by FAO for all countries with sufficient time coverage. FAO uses the geometric mean of the monthly indices of the year 2010 as the rescaling factor. *Source:* IMF, UNSD, OECD and national statistics' websites *Owmer:* IMF, UNSD and FAO

Credit to agriculture

This dataset is built by compiling official country data published online by national central banks in their monetary and financial statistics publications.

Source: FAO, Statistics Division Owner: FAO

Cropland

Land used for cultivation of crops. The total of areas under "Arable land" and "Permanent crops". *Source:* FAO, Statistics Division *Owner:* FAO

Cropping intensity ratio

The ratio of area harvested to total cropland. The cropping intensity ratio may exceed 1 where more than one crop cycle is permitted each year on the same area.

Source: FAO, Statistics Division Owner: FAO

Crops

Crop statistics include permanent and temporary crops and cover the following categories: Crops primary, Fibre crops primary, Cereals, Coarse grain, Citrus fruit, Fruit, Oil crops (oil and cakes equivalent), Pulses, Roots and tubers, Treenuts and Vegetables. *Source:* FAO, Statistics Division *Owmer:* FAO

Dairy products

Refers to group Milk equivalent including: butter, buttermilk, cheese, cream, ghee, milk, whey and yoghurt. *Source*: FAO, Statistics Division *Owner*: FAO

Dietary energy supply (kcal/cap/day)

The food available for human consumption, expressed in kilocalories per person per day. At the country level, it is calculated as the food remaining for human use after taking out all non-food utilization, including exports, industrial use, animal feed, seed, wastage and changes in stocks.

Source: FAO, Statistics Division Owner: FAO

Dietary energy supply adequacy, average

Expresses the Dietary energy supply (DES) as a percentage of the Average dietary energy requirement (ADER). Each country's or region's average supply of calories for food consumption is normalized by the average dietary energy requirement estimated for its population to provide an index of adequacy of the food supply in terms of calories. *Source:* FAO, Statistics Division *Owner:* FAO

Dietary energy supply, average

These figures are based on the latest available data from national food balance sheets, which for most countries refer to a year between 2013 and 2016. *Source:* FAO, Statistics Division *Owner:* FAO

Dietary energy supply, share

Expresses the energy supply (in kcal/cap/day) provided by a commodity group as a percentage of the total Dietary energy supply (DES) (in kcal/cap/day) calculated from the corresponding countries in the FAOSTAT food balance sheets.

Source: FAO, Statistics Division Owner: FAO

Drinking water services, at least basic

The percentage of people using at least basic water services. This indicator encompasses people using basic water services as well as those using safely managed water services. Basic drinking water services is defined as drinking water from an improved source, provided collection time is not more than 30 minutes for a round trip. Improved water sources include piped water, boreholes or tubewells, protected dug wells, protected springs, and packaged or delivered water.

Source: World Bank

Owner: WHO/UNICEF Joint Monitoring Programme (JMP) for Water Supply, Sanitation and Hygiene (washdata.org)

Eggs, primary

Egg production by type of poultry should refer to the total production of eggs in the shell by all types of hens in both the traditional sector (individually owned small flocks) and the modern sector (large-scale, intensive commercial poultry farms). Total production includes eggs for hatching but excludes farm waste.

Source: FAO, Statistics Division Owner: FAO

Emissions from agriculture, forestry and other land use (AFOLU)

Contains all the emissions produced in the different agricultural emissions subdomains, providing a picture of the contribution to the total amount of GHG emissions from agriculture. GHG emissions from agriculture consist of non-CO2 gases, namely methane (CH4) and nitrous oxide (N2O), produced by crop and livestock production and management activities. Land use includes CO2 emissions by sources and removals by sinks from forest land, cropland and grassland, as well as emissions of non-CO2 from fires of biomass and organic soils.

Source: FAO, Statistics Division and Global Forest Resources Assessments *Owner:* FAO

Emissions in agriculture

Emissions in agriculture contains all the emissions produced in the different agricultural emissions subdomains

fermentation. (enteric manure management, rice cultivation, synthetic fertilizers, manure applied to soils, manure left on pastures, crop residues, cultivation of organic soils, burning of crop residues, burning of savanna, energy use), providing a picture of the contribution to the total amount of GHG emissions from agriculture. GHG emissions from agriculture consist of non-CO₂ gases, namely methane (CH₄) and nitrous oxide (N₂O), produced by crop and livestock production and management activities. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories.

Source: FAO, Statistics Division Owner: FAO

Emissions in land use

Land Use Total contains all GHG emissions and removals produced in the different Land Use subdomains. representing the three IPCC Land Use categories: cropland, forest land, and grassland, collectively called emissions/removals from the Forestry and Other Land Use (FOLU) sector. FOLU emissions consist of CO2 (carbon dioxide), CH₄ (methane) and N₂O (nitrous oxide) associated with land management activities. CO2 emissions/removals are derived from estimated net carbon stock changes in above and below-ground biomass pools of forest land, including forest land converted to other land uses. CH₄ and N₂O, and additional CO₂ emissions are estimated for fires and drainage of organic soils. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories Source: FAO, Statistics Division Owner: FAO

Emissions in peatland

Calculated as emissions (CO₂eq) for cropland organic soils + grassland organic soils + burning - biomass organic soils. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories. *Source:* FAO, Statistics Division *Owner:* FAO

Employment in agriculture (total population, male, female)

Information on people of working age (15–64) who, during a specified brief period, were classified in the following categories: (i) paid employment (whether at work or with a job but not at work); (ii) self-employment (whether at work or with an enterprise but not at work). Data are disaggregated by economic activity according to the latest version of the International Standard Industrial Classification of All Economic Activities (ISIC) available for that year. The economic activity is the main activity of the establishment in which a person worked during the reference period. It does not depend on the specific duties or functions implied by the job; it rather depends on the characteristics of the economic unit in which this person works.

Source: ILO Owner: ILO

Export value

Export values are reported as FOB (free on board – that is, the value of the goods plus the value of the services performed to deliver the goods to the border of the exporting country).

Source: FAO, Statistics Division Owner: FAO

Fertilizers

Collected through individual countries in product weight through the new FAO Questionnaire on Agricultural Resources - Fertilizers, and then converted to nutrients and validated for consistency regarding summary totals of production, import, export, non-fertilizer use and consumption for the three types of fertilizers: nitrogen (N), phosphate (P_2O_5) , potash (K_2O) and including complex fertilizers (NP, PK, NK and NPK). Fertilizers may be organic, inorganic or mineral. Organic fertilizers play an important role in crop production and are derived from animals, plants and compost. Mineral fertilizers are available to farmers in solid or liquid form, and are delivered to the farm either in bulk, in bags or in pressurized containers. All fertilizers contain at least one of the major plant nutrients: nitrogen (N), phosphorus (P) or potassium (K). Source: FAO, Statistics Division

Owner: FAO

Fish net trade

Calculated as exports plus re-exports minus imports.

Source: Fisheries and Aquaculture Department (Fishery and Aquaculture statistics) *Owner:* FAO

Fish production indices

Calculated as current year's value divided by average 2004–06 value multiplied by 100. Production comprises capture and aquaculture.

Source: Fisheries and Aquaculture Department (Fishery and Aquaculture statistics) *Owner:* FAO

Food

Food comprises the commodities in SITC sections 0 (food and live animals), 1 (beverages and tobacco), and 4 (animal

and vegetable oils and fats) and SITC division 22 (oil seeds, oil nuts and oil kernels).

Source: FAO, Statistics Division Owner: FAO

Food import value as share of total merchandise exports

Provides a measure of vulnerability and captures the adequacy of foreign exchange reserves to pay for food imports, which has implications for national food security depending on production and trade patterns. Data for fish are excluded.

Source: FAO, Statistics Division Owner: FAO

Food price index

The FAO food price index is a measure of the monthly change in international prices of a basket of food commodities. It consists of the average of five commodity group price indices (meat, dairy, cereals, vegetables oils and sugar), weighted with the average export shares of each of the groups for 2002–04. *Source:* FAO, Statistics Division

Source: FAO, Statistics Division *Owner:* FAO

Food Production Value (net)

Value of net production has been compiled by multiplying net production in physical terms by output prices at the farm gate. Thus, value of production measures production in monetary terms at the farm gate level. Intermediate uses within the agricultural sector (seed and feed) have been subtracted from production data to calculate net production.

Source: FAO, Statistics Division Owner: FAO

Food production variability, per capita

Corresponds to the variability of the "food net per capita production value in constant 2004–06 international dollars" as disseminated in FAOSTAT. *Source:* FAO, Statistics Division *Owner:* FAO

Food production, average value

In international dollars (I\$) divided by the total population. It provides a cross country comparable measure of the relative economic size of the food production. *Source:* FAO, Statistics Division

Owner: FAO

Food supply variability, per capita

Corresponds to the variability of the "food supply in kcal/cap/day" as disseminated in FAOSTAT. *Source:* FAO, Statistics Division *Owner:* FAO

Forest land

Land spanning more than 0.5 hectares with trees higher than 5 metres and a canopy cover of more than 10 percent, or trees able to reach these thresholds in situ. Excludes land that is predominantly under agricultural or urban land use, and land that is predominantly used for maintenance and restoration of environmental function. Explanatory notes:

 Forest land is determined both by the presence of trees and by the absence of other predominant land uses. The trees should be able to reach a minimum height of 5 metres in situ.

 Includes areas with young trees that have not yet reached but that are expected to reach a canopy cover of 10 percent and tree height of 5 metres. It also includes areas that are temporarily unstocked owing to clear-cutting as part of a forest management practice or natural disasters, and that are expected to be regenerated within five years. Local conditions may, in exceptional cases, justify the use of a longer time frame.

• Includes forest roads, firebreaks and other small open areas.

 May include forest land in national parks, nature reserves and other protected areas, such as those of specific environmental, scientific, historical, cultural or spiritual interest.

 Includes windbreaks, shelter belts and corridors of trees with an area of more than 0.5 hectares and width of more than 20 metres.

 Includes abandoned shifting cultivation land with a regeneration of trees that have, or is expected to reach, a canopy cover of 10 percent and tree height of 5 metres.

• Includes areas with mangroves in tidal zones, regardless of whether this area is classified as land area or not.

• Includes areas with bamboo and palms provided that land use, height and canopy cover criteria are met.

 Some agroforestry systems such as the taungya system, where crops are grown only during the first years of the forest rotation should be classified as forest.

 Excludes tree stands in agricultural production systems, such as fruit-tree plantations (permanent crops), oil palm plantations, rubber and Christmas trees (permanent crops) and agroforestry systems when crops are grown under tree cover.

Source: FAO, Statistics Division Owner: FAO

Forest products import and export

Includes the following products: Chemical wood pulp; Dissolving wood pulp; Fibreboard, compressed (1961– 1994); Hardboard; Industrial roundwood, coniferous (export/import); Industrial roundwood, non-coniferous non-tropical; export/import); Industrial roundwood, non-coniferous tropical (export/import); MDF/HDF; Mechanical wood pulp; Newsprint; Other agglomerates; Other fibreboard; Other industrial roundwood, all species (export/import, 1961-1989); Other industrial roundwood, coniferous Other (production); industrial roundwood, non-coniferous (production); Other paper and paperboard; Particle board and OSB; Plywood; Printing and writing papers; Pulp from fibres other than wood; Pulpwood and particles, coniferous (production, 1961-97): Pulpwood and particles, non-coniferous (production, 1961-97); Pulpwood, round and split, all species (export/import, 1961-89); Recovered paper; Sawlogs and veneer logs, coniferous; Sawlogs and veneer logs, non-coniferous; Sawnwood, coniferous; Sawnwood, non-coniferous all; Semi-chemical wood pulp; Veneer sheets; Wood charcoal; Wood chips and particles; Wood fuel, all species (export/import); Wood pellets; Wood residues

Source: FAO, Forestry Department Owner: FAO

Freshwater withdrawal as % of total renewable water resources

Total freshwater withdrawn in a given year, expressed as a percentage of the total renewable water resources (TRWR). This parameter is an indication of the pressure on the renewable water resources. It was the Millennium Development Goal (MDG) Indicator 7.5, from which the Sustainable Development Goal (SDG) indicator 6.4.2 is derived with the introduction of Environmental Flow Reauirements.

Source: FAO, Land and Water Division (AQUASTAT) Owner: FAO

Fruit and vegetables

Vegetables, as classified in this group, are mainly annual plants cultivated as field and garden crops in the open and under glass, and used almost exclusively for food. Vegetables grown principally for animal feed or seed should be excluded. Certain plants, normally classified as cereals and pulses, belong to this group when harvested green, such as green maize, green peas, etc. Chillies and green peppers are included in this grouping when they are harvested for consumption as vegetables and not processed into spices. Trade data for fresh vegetables also include chilled vegetables, meaning the temperature of the products has been reduced to around 0°C without the products being frozen. Fruit crops consist of fruits and berries that, with few exceptions, are characterized by their sweet taste. Nearly all are permanent crops, mainly from trees, bushes and shrubs, as well as vines and palms. Fruit crops are consumed directly as food and are processed into dried fruit, fruit juice, canned fruit, frozen fruit, jam, alcoholic beverages, etc.

Source: FAO, Statistics Division Owner: FAO

GDP per capita (constant 2011 international \$, PPP)

GDP per capita based on purchasing power parity (PPP). PPP GDP is gross domestic product converted to international dollars using purchasing power parity rates. An international dollar has the same purchasing power over GDP as the USD has in the United States of America. GDP at purchaser's prices is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources. Data are in constant 2011 international dollars.

Source: World Bank Owner: World Bank

Government expenditure on agriculture

This refers to core areas of government functions relevant to agriculture, forestry and fishing (AFF) based on the Classification of Functions of Government (COFOG) as outlined in the Government Finance Statistics Manual of IMF, 2001 (GFSM 2001). Statistics on expenditure in AFF are used to compile an Agriculture Orientation Index (AOI). *Source:* FAO, Statistics Division *Owmer:* FAO and IMF

Growth rate, average annual

Calculated using a least squares growth rate with at least 50 percent of the values present in the time series. *Source:* FAO, Statistics Division *Owner:* FAO

Growth rate, geometric

Calculated using a geometric growth rate with at least 50 percent of the values present in the time series. *Source:* FAO, Statistics Division *Owner:* FAO

Import value

Import values are reported as CIF (cost insurance and freight – that is, the value of the goods, plus the value of the services performed to deliver goods to the border of the exporting country, plus the value of the services performed to deliver the good from the border of the exporting country to the border of the importing country). Source: FAO, Statistics Division Owner: FAO

Import value index

Value indices represent the change in the current values of import CIF (cost, insurance and freight) all expressed in USD. For countries which report import values on an FOB (free on board) basis, these are adjusted to approximate CIF values (by a standard factor of 112 percent).

Source: FAO, Statistics Division Owner: FAO

Industrial water withdrawal

Refers to the annual quantity of selfsupplied water withdrawn for industrial uses. It can include water from primary renewable and secondary freshwater resources, as well as water from overabstraction of renewable groundwater or withdrawal from fossil groundwater, direct use of agricultural drainage water, direct use of (treated) wastewater, and desalinated water. This sector refers to self-supplied industries not connected to the public distribution network. The ratio between net consumption and withdrawal is estimated at less than 5 percent. It includes water for the cooling of thermoelectric and nuclear power plants, but it does not include hydropower. Water withdrawn by industries that are connected to the public supply network is generally included in municipal water withdrawal. Source: FAO, Land and Water Division (AOUASTAT) Owner: FAO

Industry, value added

Industry corresponds to ISIC Divisions 10-45 and includes manufacturing (ISIC Divisions 15-37). It comprises value added in mining, manufacturing (also reported as a separate subgroup), construction, electricity, water, and gas. Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The origin of value added is determined by the International Standard Industrial Classification (ISIC), revision 3 or 4. Source: World Bank Owner: World Bank

Inflation rate

Inflation rate for any month refers to the percentage change in the Index number for the month as compared to the Index number of the corresponding month of the previous year. Global and regional food consumer price inflation measures food inflation for a group of countries at different geographical scales: Africa, Europe, Oceania, Latin America and the Caribbean, North America and Asia. Global and regional inflation are calculated using population weights, which may better reflect the impact of food inflation on consumers than indicators such as GDP weights. *Source:* FAO, Statistics Division *Owner:* FAO

Total renew. water resources

Total renew. water resources (IRWR) refers to long-term average annual flow of rivers and recharge of aquifers generated from endogenous precipitation. Double counting of surface water and groundwater resources is avoided by deducting the overlap from the sum of the surface water and groundwater resources.

Source: FAO, Land and Water Division (AQUASTAT) Owner: FAO

Labour force participation rate

The proportion of the population aged 15-64 that is economically active: all people who supply labour for the production of goods and services during a specified period. *Source:* World Bank *Owner:* KILM database, ILO

Land area

Country area excluding area under inland waters and coastal waters. Source: FAO, Statistics Division Owner: FAO

Land area equipped for irrigation

Land area equipped with irrigation infrastructure and equipment, in working order, to provide water to crops. The equipment does not have to be used during the reference year. The area equipped for irrigation covers areas equipped for fully controlled irrigation by any of the methods of surface, sprinkler or localized irrigation. It also includes areas under partially controlled irrigation methods of spate irrigation (controlling floodwater to water crops), equipped wetlands and inland valley bottoms and equipped flood recession. It excludes manual watering of plants using buckets, watering cans or other devices. Source: FAO, Statistics Division

Owner: FAO

Land under permanent crops

Land cultivated with long-term crops which do not have to be replanted for several years (such as cocoa and coffee), land under trees and shrubs producing flowers (such as roses and jasmine), and nurseries (except those for forest trees, which should be classified under "Forestry"). Permanent meadows and pastures are excluded from land underpermanent crops. Source: FAO, Statistics Division Owner: FAO

Land under permanent meadows and pastures

Land used permanently (five years or more) to grow herbaceous forage crops through cultivation or naturally (wild prairie or grazing land). Permanent meadows and pastures on which trees and shrubs are grown should be recorded under this heading only if the growing of forage crops is the most important use of the area. Measures may be taken to keep or increase productivity of the land (i.e. use of fertilizers, mowing or systematic grazing by domestic animals.) This class includes:

• Grazing in wooded areas (agroforestry areas, for example)

• Grazing in shrubby zones (heath, maquis, garigue)

 Grassland in the plain or low mountain areas used for grazing: land crossed during transhumance where the animals spend a part of the year (approximately 100 days) without returning to the holding in the evening: mountain and subalpine meadows and similar; and steppes and dry meadows used for pasture.

Source: FAO, Statistics Division Owner: FAO

Life expectancy at birth (years)

Indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.

Source: World Bank

Owner: UNPD World Population Prospects 2010

Live animals

Includes: asses, buffaloes, beehives, camels, other camelids, cattle, chickens, ducks, geese and guinea fowl, goats, horses, mules, pigeons, other birds, pigs, rabbits and hares, other rodents, sheep, turkeys and live animals nes. *Source*: FAO, Statistics Division *Owner*: FAO

Livestock primary production

Includes products from live and slaughtered animals. Products from slaughtered animals include meat, offals, raw fats, fresh hides and skins. Products from live animals include milk, eggs, honey, beeswax and fibres of animal origin.

Source: FAO, Statistics Division Owner: FAO

Meat

FAO defines meat as the flesh of animals used for food. In production data, meat is

normally reported inclusive of bone and exclusive of meat that is unfit for human consumption. As reported by individual countries, meat production data may refer either to commercial production (meat entering marketing channels), inspected production (from animals slaughtered under sanitary inspection), or total production (the total of the above-mentioned categories plus slaughter for personal consumption). All FAO annual production data refer to total production.

Source: FAO, Statistics Division Owner: FAO

Milk

Whole fresh milk production from buffaloes, camels, cows, goats and sheep. *Source:* FAO, Statistics Division *Owner:* FAO

Multilateral development flow (aid) to AFF

Multilateral flows are channelled via an international organization active in development (e.g. World Bank, UNDP). Commitments of aid are reported as the sum of (i) any disbursements in the year reported on which have not previously been notified as commitments and (ii) expected disbursements in the following year.

Source: OECD Owner: OECD

Net emissions/removal from forest land

Net CO₂ emissions/removals from forest land consist of net carbon stock change in the living biomass pool (aboveground) and belowground) associated with: (i) forest, referring to changes occurred on forest land in the reported year; and (ii) net forest conversion from forest land to other land uses. The FAOSTAT data are computed at Tier 1, with the stock difference method, following IPCC 2006 Vol. 4, Ch. 2 and 4.

Source: FAO, Statistics Division Owner: FAO

Net forest conversion, net emissions/removal

Annual net CO₂ emission/removal from forest land consist of net carbon stock gain/loss in the living biomass pool (aboveground and belowground biomass) associated with forest and net forest conversion. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories and using area and carbon stocks data compiled by countries in the FAO Global Forest Resource Assessments.

Source: FAO, Statistics Division Owner: FAO

Net trade

Value in USD of exports - imports. Source: FAO, Statistics Division Owner: FAO

Offals

Can include edible offals from cattle, buffaloes, sheep, goats, pigs, horses, camels and other camelids, liver preparations, and liver from chickens, geese, ducks and turkeys. *Source:* FAO, Statistics Division *Owner:* FAO

Organic area

Sum of areas under "Agricultural area certified organic" and "Agricultural area in conversion to organic". Agricultural area certified organic is the land area exclusively dedicated to organic agriculture and managed by applying organic agriculture methods. It refers to the land area fully converted to organic agriculture. It is the portion of land area (including arable lands, pastures or wild areas) managed (cultivated) or wild harvested in accordance with specific organic standards or technical regulations and that has been inspected and approved by a certification body. Agricultural area in conversion to organic is the land area which is going through the organic conversion process, usually a two-year period of conversion to organic land

Source: FAO, Statistics Division Owner: FAO

Other naturally regenerated forest

Naturally regenerated forest where there are clearly visible indications of human activities. Explanatory notes:

 Includes selectively logged-over areas, areas regenerating following agricultural land use, areas recovering from humaninduced fires, etc.

Includes forests where it is not possible to distinguish whether planted or naturally regenerated.

3. Includes forests with a mix of naturally regenerated trees and planted/seeded trees, and where the naturally regenerated trees are expected to constitute more than 50 percent of the growing stock at stand maturity.

Source: Global Forest Resources Assessment, FAO Owner: FAO

Owner: FAO

Paper and paperboard

The paper and paperboard category is an aggregate category. In the production and trade statistics, it represents the sum of graphic papers; sanitary and household papers; packaging materials and other paper and paperboard. It excludes manufactured paper products such as boxes, cartons, books and magazines, etc.

Source: FAO, Forestry Department Owner: FAO

Pesticides

Refer to insecticides, fungicides, herbicides, disinfectants and any substance or mixture of substances intended for preventing, destroying or controlling any pest, including vectors of human or animal disease, unwanted species of plants or animals causing harm during or otherwise interfering with the production, processing, storage, transport or marketing of food, agricultural commodities, wood and wood products or animal feedstuffs, or substances which may be administered to animals for the control of insects. arachnids or other pests in or on their bodies. The term includes substances intended for use as a plant growth regulator, defoliant, desiccant or agent for thinning fruit or preventing the premature fall of fruit, and substances applied to crops either before or after harvest to protected the commodity from deterioration during storage and transport. Pesticides use data refers to quantities of pesticides applied to crops and seeds in the agricultural sector. Figures are expressed in metric tonnes of active ingredients. However, due to some country reporting practices, the data may be reported by: use in formulated product: sales: distribution or imports for use in the agricultural sector.

Source: FAO, Statistics Division Owner: FAO

Planted forest

Forest predominantly composed of trees established through planting and/or deliberate seeding. Explanatory notes:

 In this context, predominantly means that the planted/seeded trees are expected to constitute more than 50 percent of the growing stock at maturity.
 Includes coppice from trees that were originally planted or seeded.

3. Includes rubberwood, cork oak and Christmas tree plantations.

4. Excludes self-sown trees of introduced species.

Source: Global Forest Resources Assessment, FAO *Owner:* FAO

Population, rural

De facto population living in areas classified as rural (that is, it is the difference between the total population of a country and its urban population). Data refer to 1 July of the year indicated. *Source:* FAO, Statistics Division

Owner: United Nations, World Urbanization Prospects – the 2014 Revision

Population, total

De facto population in a country, area or region as of 1 July of the year indicated. *Source:* FAO, Statistics Division *Owner:* United Nations, World Population Prospects – the 2017 Revision

Population, urban

De facto population living in areas classified as rural (that is, it is the difference between the total population). Data refer to 1 July of the year indicated. *Source:* FAO, Statistics Division

Owner: United Nations, World Urbanization Prospects – the 2014 Revision

Primary forest

Naturally regenerated forest of native species, where there are no clearly visible indications of human activities and the ecological processes are not significantly disturbed. Some key characteristics of primary forests are:

 they show natural forest dynamics, such as natural tree species composition, occurrence of dead wood, natural age structure and natural regeneration processes;

• the area is large enough to maintain its natural characteristics;

 there has been no known significant human intervention or the last significant human intervention was long enough ago to have allowed the natural species composition and processes to have become re-established.

Source: Global Forest Resources Assessment, FAO *Owner:* FAO

Private development flow (aid) to AFF

It consists of flows at market terms financed out of private sector resources (i.e. changes in holdings of private longterm assets held by residents of the reporting country) and private grants (i.e. grants by non-governmental organizations and other private bodies, net of subsidies received from the official sector).

Source: OECD Owner: OECD

Production

Figures relate to the total domestic production whether inside or outside the agricultural sector, i.e. it includes noncommercial production and production from kitchen gardens. Unless otherwise indicated, production is reported at the farm level for crop and livestock products (i.e. in the case of crops, excluding harvesting losses) and in terms of live weight for fish items (i.e. the actual exwater weight at time of catch). All data shown relate to total meat production from both commercial and farm slaughter. Data are expressed in terms of dressed carcass weight, excluding offal and slaughter fats. Production of beef and buffalo meat includes veal; mutton and goat meat includes meat from lambs and kids; pig meat includes bacon and ham in fresh equivalent. Poultry meat includes meat from all domestic birds and refers, wherever possible, to readyto-cook weight.

Source: FAO, Statistics Division Owner: FAO

Production indices

The FAO indices of agricultural production show the relative level of the aggregate volume of agricultural production for each year in comparison with the base period 2004–06. It should be noted that when calculating indices of agricultural, food and non-food production, all intermediate primary inputs of agricultural origin are deducted. *Source:* FAO, Statistics Division *Owner:* FAO

Production, crops

Refer to the actual harvested production from the field or orchard and gardens, excluding harvesting and threshing losses and that part of crop not harvested for any reason. Production therefore includes the quantities of the commodity sold in the market (marketed production) and the quantities consumed or used by the producers (auto-consumption). When the production data available refers to a production period falling into two successive calendar years and it is not possible to allocate the relative production to each of them, it is usual to refer production data to that year into which the bulk of the production falls. Crop production data are recorded in tonnes (t). In many countries, crop production data are obtained as a function of the estimated yield and the total area. If such a compilation method of production statistics is enforced by the country, it must be ensured that the total area does not refer to sown or planted area, which would give then the biological production, but to the actually harvested area during the year. Source: FAO, Statistics Division Owner: FAO

Protein supply of animal origin, average

National average protein supply (expressed in grams per capita per day). Includes the following groups: meat; offals; animal fats and products; milk and products; eggs, fish, seafood and products; and aquatic products, other. *Source*: FAO, Statistics Division *Owner*: FAO

Protein supply, average

National average protein supply (expressed in grams per capita per day). Source: FAO, Statistics Division Owner: FAO

Rail lines density

Rail lines density corresponds to the ratio between the length of railway route available for train services, irrespective of the number of parallel tracks (rail lines, total route in km) with the area of the country.

Source: FAO, Statistics Division Owner: World Bank

Recovered paper

Waste and scraps of paper or paperboard that have been collected for reuse or trade. It includes paper and paperboard that has been used for its original purpose and residues from paper and paperboard production.

Source: FAO, Forestry Department Owner: FAO

Renewable water resources

Total renewable water resources refers to the sum of internal renewable water resources and external renewable water resources. It corresponds to the maximum theoretical yearly amount of water available for a country at a given moment.

Source: FAO, Land and Water Division (AQUASTAT) Owner: FAO

Roots and tubers

Roots and Tubers are plants yielding starchy roots, tubers, rhizomes, corms and stems. The denomination "roots and tubers" excludes crops which are cultivated mainly for feed (mangolds, swedes) or for processing into sugar (sugar beets), and those classified as "roots, bulb and tuberous vegetables" (onions, garlic and beets).

Source: FAO, Statistics Division Owner: FAO

Safely managed drinking water services (% of population using)

The percentage of people using drinking water from an improved source that is accessible on premises, available when needed and free from faecal and priority chemical contamination. Improved water sources include piped water, boreholes or tubewells, protected dug wells, protected springs, and packaged or delivered water.

Source: World Bank

Owner: WHO/UNICEF Joint Monitoring Programme (JMP) for Water Supply, Sanitation and Hygiene (washdata.org)

Sanitation services, at least basic

The percentage of people using at least basic sanitation services, that is, improved sanitation facilities that are not shared with other households. This indicator encompasses people using basic sanitation services as well as those using safely managed sanitation services. Improved sanitation facilities include flush/pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, compositing toilets or pit latrines with slabs. *Source:* World Bank Owner: World Bank

Services, value added

Services correspond to the International Standard Industrial Classification (ISIC) Divisions 50-99 and they include value added in wholesale and retail trade (including hotels and restaurants), transport, and government, financial, professional and personal services such as education, health care and real estate services. Also included are imputed bank service charges, import duties, and any statistical discrepancies noted bv national compilers as well as discrepancies arising from rescaling. Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The industrial origin of value added is determined by the International Standard Industrial Classification (ISIC) revision 3 or 4. Source: World Bank Owner: World Bank

Severe food insecurity, prevalence

The prevalence of severe food insecurity is an estimate of the percentage of people in the population who live in households classified as severely food insecure. The assessment is conducted using data collected with the FIES or a compatible experience-based food security measurement questionnaire (such as the HFSSM, the HFIAS, the EBIA, the ELCSA, etc.). The probability to be food insecure is estimated using the oneparameter logistic Item Response Theory model (the Rasch model) and thresholds for classification are made cross country comparable by calibrating the metrics obtained in each country against the FIES global reference scale, maintained by FAO. The threshold to classify "severe" food insecurity corresponds to the severity associated with the item "having not eaten for an entire day" on the global FIES scale. In simpler terms, a household is classified as severely food insecure when at least one adult in the household has reported to have been exposed, at times during the year, to several of the most severe experiences described in the FIES questions, such as to have been forced to reduce the quantity of the food, to have skipped meals, having gone hungry, or having to go for a whole day without eating because of lack of money or other resources. It is an indicator of lack of food access.

Source: FAO, Statistics Division Owner: FAO

Severely food insecure people, number

Estimated number of people living in households classified as severely food insecure. It is calculated by multiplying the estimated percentage of people affected by severe food insecurity by the total population.

Source: FAO, Statistics Division Owner: FAO

Starchy roots

Includes cassava and products, potatoes and products, sweet potatoes and other roots. *Source:* FAO, Statistics Division

Owner: FAO

Stunting, children under 5 years of age

Height-for-age less than -2 standard deviations of the WHO Child Growth Standards median, among children aged 0–59 months.

Source: World Bank

Owner: UNICEF/WHO/The World Bank: Joint child malnutrition estimates

Sugar

Includes: sugar beet, sugar cane, sugar crops nes. Source: FAO, Statistics Division Owner: FAO

Sweeteners

Can include fructose, maltose, maple sugar and syrups, molasses, glucose and dextrose, lactose, isoglucose, nonalcoholic beverages, sugar and sugar crops not elsewhere specified. *Source:* FAO, Statistics Division *Owner:* FAO

Terrestrial protected areas (% total land area)

Totally or partially protected areas of at least 1 000 hectares that are designated by national authorities as scientific reserves with limited public access, national parks, natural monuments, nature reserves or wildlife sanctuaries, protected landscapes, and areas managed mainly for sustainable use. Marine areas, unclassified areas, littoral (intertidal) areas, and sites protected under local or provincial law are excluded.

Source: World Bank

Owner: United Nations Environmental Program and the World Conservation Monitoring Centre, as compiled by the World Resources Institute

Undernourished, number of people

Number of people in a condition of undernourishment. The number of people undernourished is obtained by multiplying estimates of the proportion of undernourished for each country by estimates of the total population. Undernourishment refers to the condition of people whose dietary energy consumption is continuously below a minimum dietary energy requirement for maintaining a healthy life and carrying out a light physical activity. *Source:* FAO, Statistics Division *Owner:* FAO

Undernourishment, prevalence

Expresses the probability that a randomly selected individual from the population consumes an amount of calories that is insufficient to cover their energy requirement for an active and healthy life. The indicator is computed by comparing a probability distribution of habitual daily dietary energy consumption with a threshold level called the minimum dietary energy requirement. Both are based on the notion of an average individual in the reference population. *Source:* FAO, Statistics Division

Owner: FAO

Vegetable oils

Refers to the oil equivalent of oilcrops, which include seeds, nuts, oil palm fruit, olives and soybeans. Source: FAO, Statistics Division Owner: FAO

Wasting, children under 5 years of age

Weight-for-height is more than two standard deviations below the median for the international reference population aged 0–59 months. *Source:* World Bank *Owner:* UNICEF/WHO/The World Bank: Joint child malnutrition estimates

Wood pellet production

Wood agglomerates produced from coproducts (such as cutter shavings, sawdust or chips) of the mechanical wood processing industry, furnituremaking industry or other wood transformation activities. They are produced either directly by compression or by the addition of a binder in a proportion not exceeding 3 percent by weight. Such pellets are cylindrical, with a diameter not exceeding 25 mm and a length not exceeding 100 mm. Source: FAO, Forestry Department Owner: FAO

Wood pulp

material prepared Fibrous from pulpwood, wood chips, particles or residues by mechanical and/or chemical process for further manufacture into paper, paperboard, fibreboard or other cellulose products. It is an aggregate comprising mechanical wood pulp; semichemical wood pulp; chemical wood pulp; and dissolving wood pulp. It is reported in metric tonnes air-dry weight (i.e. with 10 percent moisture content). Source: FAO, Forestry Department Owner: FAO

Yield, crops

Harvested production per unit of harvested area for crop products. In most of the cases yield data are not recorded but are obtained by dividing the production data by the data on area harvested. Data on yields of permanent crops are not as reliable as those for temporary crops either because most of the area information may correspond to planted area, as for grapes, or because of the scarcity and unreliability of the area figures reported by the countries, as for example for cocoa and coffee.

Source: FAO, Statistics Division Owner: FAO Good decisions are based on accurate information. Since its foundation, FAO is at the forefront of providing internationally comparable, sound and timely data on world agriculture and food security. This pocketbook offers easy access to the most important FAOSTAT data, at a glance.
